

Orders break at the handoff.

Overwatch coordinates warehouse work across people, AI planning and robot transport.

A wrong pick, an unrecorded stock move or a missing item can turn one order into rework and a second shipment.

Starting context: Aditya's work in USC bookstore / mailroom storage. The current site is human-operated.

The handoff needs a shared record

50+

staff conversations reported by
Aditya

Staff asked for item verification, accurate stock after every move, and clear ownership when work gets blocked.

Initial customer hypothesis

Small warehouse teams adopting mixed human and robot workflows. The first accessible discovery setting is campus storage.

Competition includes warehouse management software and fleet orchestration providers such as Formant and SVT Robotics.

Evidence: user-reported informal conversations, not a representative survey. Competitor references: formant.ai/fleet-orchestration and svtrobotics.com.

One goal becomes executable work

"Fulfill order #1042"

PLAN + APPROVE

A planner proposes the work. The supervisor approves it.

VERIFY + HAND OFF

A person replenishes stock and verifies picks. The confirmed tote releases a robot mission.

RECOVER + COMPLETE

An obstruction changes the route. Arrival unlocks receipt, checking, packing and dispatch.

Implemented local demo. Robot motion and goods are simulated. Live AI requires a configured API key; the current no-key mode is labeled rules-based.

The work record drives the next action

Item accuracy

Wrong IDs are rejected before stock changes. Missing order contents prevent dispatch.

Inventory integrity

Reserve available stock, move it into the tote, then decrement on-hand at carrier handoff.

Exception ownership

A blocked mission raises an incident. Every recovery and handoff names the responsible actor.

Pilot measures: inventory discrepancies, incomplete dispatches and time to recover from blocked work. No savings claim yet.

Start with one warehouse team

Buyer	An operations manager responsible for fulfillment accuracy and coordination.
Revenue	A site subscription, with an optional integration fee when connecting a real robot fleet. Validate willingness to pay first.
First customers	Begin with a supervised campus pilot. Test referrals through warehouse operators and robot integrators as a route to the first 100 customers.

All buyer, pricing and acquisition statements are hypotheses. No signed customer, revenue or robot deployment is claimed.

Next: one supervised pilot

BUILT

A working order workflow
Verified stock movements
Robot rerouting and failure handling
Supervisor and worker communication
A shared event history

VALIDATE NEXT

Run in shadow mode with a willing site.

Measure errors and recovery time.

Connect one real robot, then move to a shared authenticated backend.

Showcase: the running local app, a real screen recording, and this six-slide pitch. Public deployment and live AI access require separate setup.
